### University

#### Our Vision and Principles

In 1973, the Universität zu Lübeck became an independent scientific institution in the state of Schleswig-Holstein. We offer degree programmes in medicine, computer science, engineering, and natural sciences. Interdisciplinary programmes encompassing natural sciences, computer science, and medicine offer practical and up-to-date education underpinned by the highest standard of healthcare. The conditions here for developing and applying innovative technologies, diagnostics, and treatments are ideal, as a result of teamwork among faculties, and collaboration with other institutions in Lübeck, the Research Center Borstel, the Medical Laser Centre, and local businesses. Teaming-up with national and international research institutes bolsters the quality of research at our university, currently defined by two special fields of research.

Compared with other universities, the Universität zu Lübeck is small, with just 3,400 students – but boasts a good teacher-student ratio. The high standings of our computer science and medicine students underscores the high standard of our teaching and education.

#### A dynamic university

We view ourselves as the initiator, and would like to apply your scientific knowledge to make a long-lasting contribution to develop our city and region. Hence, we constantly strive for exchange and collaboration with partners in the fields of science, the economy, foundations and general public. We are open to social change and constantly adapt our strategies and actions to our values. We consider ourselves an active element of society in an historic Hanseatic city rich in the traditions of science.
